

Technical project report

Public fictional-data demonstration

Convive organises listening and professional assessment of school-community communications without replacing human judgement.

Status Public fictional-data demonstration

Review 1 September 2026

Website conviveaula.com

Application app.conviveaula.com

Product and journeys

Convive is an open-source web application for receiving communications and organising their internal assessment. A communication never becomes a case automatically.

Entry	Purpose	Boundary
Public website	Explain Convive, resources and guided demonstration	Never replaces emergency services or a real school
Public reporting	Account-free journey	Follow-up through a one-time secret
Professional area	Inbox, cases, tasks, evidence and settings	Authorised people only

Architecture

Component	Responsibility
Angular 22	Public website, form, follow-up and professional workspace
Symfony 7.4 / PHP 8.5	Validation, sessions, anonymous capabilities, authorisation and audit
PostgreSQL · Redis	Fictional persistent data, abuse limits and transient state
Caddy · almacenamiento privado	Web ingress, same-origin API, evidence quarantine and scanning

Security and privacy

The interface does not grant permission. The backend requires an active professional session, organisation membership and an exact case permission. A reporter secret cannot become a professional session.

- Private evidence, quarantined and scanned before authorised access.
- No public storage URL and no fabricated fictional video.
- Operational secrets outside Git; logs without content or credentials.
- Explicit, deterministic and idempotent demo; never startup fixtures.

Verification

Each change is verified through Symfony and Angular tests, types and formatting, OpenAPI, Compose, encrypted recovery and isolated Chromium journeys. The E2E stack creates an ephemeral fictional database and removes it afterwards.

Operations and status

The public demonstration is live at conviveaula.com and the application at app.conviveaula.com. Releases use immutable images, reviewed migrations, verified backups and controlled activation of the public route. The demonstration does not authorise personal data or a real school.

Planned evolution during 2026

These directions will be prioritised after validation; they are not a product promise and do not authorise real data.

Direction	Responsible scope
Accessibility	Cognitive accessibility, plain language and screen-reader review.
Follow-up	Clearer updates for the reporter through their secure access journey.
Protocols	Maintenance of versioned territorial sources and protocols.
Languages	Expansion only after a scoped decision and qualified review.

Boundary

Out of scope: a real-data pilot, automation of educational decisions, non-essential analytics and offline behaviour. Each requires additional controller, privacy, security, operational and product decisions.
